Let's Start!

Will we receive our own regrown organs in the future?

Learning Outcome

Explain about technology and technical problems in communicative situations.

Ask your partner:

- How do you feel about organ donation?
- How common is it to fill out an organ donation card in your country?

Can Do Statements

- I can talk about technology and gadgets.
- I can speculate about feelings and impressions.
- I can talk about wishes and imaginary situations.

Let's Explore!

Will **replacement*** organs in the future be mechanical or biological?

* "Replacement" means something that does the job of the original.

Instructions: Read the text aloud.

Over 100,000 people are currently waiting for organ transplants in the US. This number can only grow in the future. All hospitals wish they had easy access to healthy organs. If you needed an organ, it would have to be closely matched to you. If the match wasn't close enough, your immune system could reject it.

In the future, people who need a body part might be able to have parts regrown or 3D printed in a lab from their own cells. Bioartificial organs might change transplanting forever. Scientists are already growing noses, ears and blood vessels. Lab-grown bladders are also successful.

Other engineered organs are in the pipeline. Wouldn't everyone wish they could have the new organ they needed, produced from their own cells? Soon this may become commonplace.

Biological structures made with 3D technology from digital files may soon be accessible. Wish you could be on the cutting edge of this new technology?

This may become the fastest growing field in the future. You could start with a 3D printing course at college, online, or even at your local library.

Let's Practice!

Engineered organs are in the pipeline*!

* "In the pipeline" means being developed.

Instructions: Draw a line to complete the missing words for sentences in Column A from Column B.

Column A

- 1) Soon we may be able to have parts of our bodies _____.
- 2) In the future people will be able to _____.
- 3) _____ are already successful today.
- 4) Other _____ are in the pipeline.
- 5) We will have biological structures made with _____.

Column B

- a) Lab-grown bladders
- b) have bioartificial organs
- c) 3D printers from digital files
- d) engineered organs
- e) regrown or 3D printed

Let's Practice!

Your body never rejects an organ grown with your own cells!

Instructions: Choose the words from the word bank to correctly complete the sentences.

- 1) All hospitals _____ easy access to healthy organs.
- 2) If you needed an organ, it _____ to be closely matched to you.
- 3) If the match _____, your immune system could reject it.
- 4) _____ they could have the new organ they needed, produced from their own cells?
- 5) _____ on the cutting edge of this new technology?

Word bank

Wish you could be
wasn't close enough
Wouldn't everyone
wish
wish they had
would have

Extension Activity

Listen to news reports on lab-grown organs.

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Look up news reports about lab-grown organs on the Internet and select videos.
- Watch one or two of the news items and take notes on the new technology.
- Prepare a short summary of the information from your notes.
- Use your summary to explain to someone what you have found out.

Self-Assessment

Yes

No

I listen to an online news video on lab-grown organs.

☐
☐

I write a clear short summary using words for new technology.

☐
☐

I use notes to explain new information to a partner.

☐
☐

Target Words

- **organ** (noun): part of a body
e.g. Organs are now being grown in labs.
- **closely** (adverb): in a close or direct way
e.g. Organs have to be closely matched to the patient receiving them.
- **to match** (verb): to be similar
e.g. When organs don't match the body can reject them.
- **immune system** (noun): the biological function that protects us from disease
e.g. Our immune system helps us fight off disease.
- **to reject** (verb): to say no to; to have a dangerous reaction to
e.g. Donor organs can be rejected.
- **bioartificial** (adjective): artificially created in a lab
e.g. Bioartificial organs grown from your own cells are a perfect match.
- **to regrow** (verb): to cause to grow again
e.g. Soon it will be possible to regrow organs in a lab.
- **3D printing** (noun): using a special device to make a 3 dimensional object
e.g. 3D printing courses are interesting and valuable to a modern education.
- **lab-grown** (adjective): created in a laboratory
e.g. This is a lab-grown bladder.
- **commonplace** (adjective): usual
e.g. Soon, lab-grown organs will be commonplace rather than rare.

Learning Points

Modal Verbs for Speculation

You can use modals to talk about degrees of certainty.

You use them to describe what is definite, probable, possible, or impossible from the speaker's point of view.

You can use *must*, *may*, *might*, and *could* to describe degrees of certainty.

In the affirmative, there is no difference between *can*, *may* and *might*. They mean that maybe it will happen.

In the negative, *can't* expresses the opposite. It means this most likely will not happen.

Modal	Meaning
<i>This number can only grow in the future.</i>	maybe they will grow in the future
<i>Bioartificial organs might change transplanting forever.</i>	maybe they will change transplanting forever
<i>Soon this may become commonplace.</i>	maybe they will become commonplace
<i>Bionics can't be the only answer.</i>	this is most likely not the only answer

Examples:

- *In the future, people who need a body part might be able to have parts regrown or 3D printed in a lab from their own cells.*
- *Biological structures made with 3D technology from digital files may soon be accessible.*
- *You could start with a 3D printing course at college, online, or even at your local library.*

Learning Points

Talking about Wishes and Imaginary Situations

You use *wish* to talk about things you do not have/do or cannot have/do.

You use the second conditional to talk about situations that are possible, but not likely.

Wishes can be expressed in the affirmative, negative and interrogative forms:

Second Conditional	
Affirmative	<i>All hospitals wish they had easy access to healthy organs.</i>
Interrogative	<i>Wish you could be on the cutting edge of this new technology?</i>
Negative	<i>No one wishes they needed a transplant.</i>

Examples:

- *If you needed an organ, it would have to be closely matched to you.*
- *If the match wasn't close enough, your immune system could reject it.*
- *Wouldn't everyone wish they could have the new organ they needed, produced from their own cells?*
